Overview

Swivel can provide strong and two factor authentication to the Check Point Mobile Access Blade. This document outlines the details required to carry this out.

Baseline

Swivel 3.x

Check Point CR75 Mobile Access Blade and newer

Prerequisites

Working Mobile Access Blade VPN

Swivel 3.x

Use of the [TURing](#), will require the use of a NAT.

When a Swivel appliance VIP is used, the real IP address should be used and not the VIP. For redundancy select Primary and Secondary RADIUS servers, see [VIP on PINsafe Appliances](#).

Downloads

Demos

TURing	SMS	Mobile App.
Check Point MAB & Swivel TURing	Check Point MAB & Swivel SMS	Check Point MAB & Swivel Mobile App.

Swivel Configuration

Configuring the RADIUS server

On the Swivel Administration console configure the RADIUS Server and NAS, see [RADIUS Configuration](#)

Enabling Session creation with username

To allow the [TURing](#) image, [PINpad](#) and other single channel images, under Server/Single Channel set [Allow session request by username](#) to Yes.

Setting up Swivel Dual Channel Transports

See [Transport Configuration](#)

Mobile Access Blade Configuration

Enabling RADIUS Authentication in Mobile Access Blade

You need to configure Swivel as an authentication server on the Mobile Access Blade

- Open Smart Dashboard and log in.
- Under Servers and OPSEC, locate the RADIUS folder and right click and select New RADIUS
- In the New RADIUS popup window click on 'New'
- Configure the Swivel server as a new host. You just need to give it a name and add the IP address.
- Select Swivel as the host, ?NEW-RADIUS? as the service, and enter the shared secret you previously set on the Swivel appliance. You can select RADIUS version 1 or 2, and PAP or MSChap as the protocol: Swivel will detect these protocols automatically. Note: When a Swivel appliance VIP is used, the real IP address should be used and not the VIP. For redundancy select Primary and Secondary RADIUS servers, see [VIP on PINsafe Appliances](#).

New RADIUS

New Host

Configure New Host

RADIUS Server Properties

Configuring AD Templates to use RADIUS

- Modify AD user template and select RADIUS.

Don't forget to save and install the policy once you have made all relevant changes.

Modify Template

Select RADIUS

Test the RADIUS authentication

At this stage it should be possible to authenticate by [SMS](#), hardware [Token](#), [Mobile Phone Client](#) and [Taskbar](#) to verify that the RADIUS authentication is working for users. Browse to the SSL VPN login page, and enter Username and if being used, the password. From the Swivel Administration console select User Administration and the required user then [View Strings](#), and select an appropriate authentication string or OTC for the user. At the SSL VPN login enter the required OTC. Check the Swivel logs for a RADIUS success or rejected message. If no RADIUS message is seen, check that the Swivel RADIUS server is started and that the correct ports are being used.

Customising the Mobile Access Blade Login Page

Modify custom LoginPage.php

Download the provided LoginPage.php

Modify the PHP file, and change the URL values to the site location (search for TURING)

Connect to the Check Point Appliance

Use WinSCP to connect to the Check Point Appliance, and retrieve a copy and keep safe keeping of the login page (LoginPage.php) from:

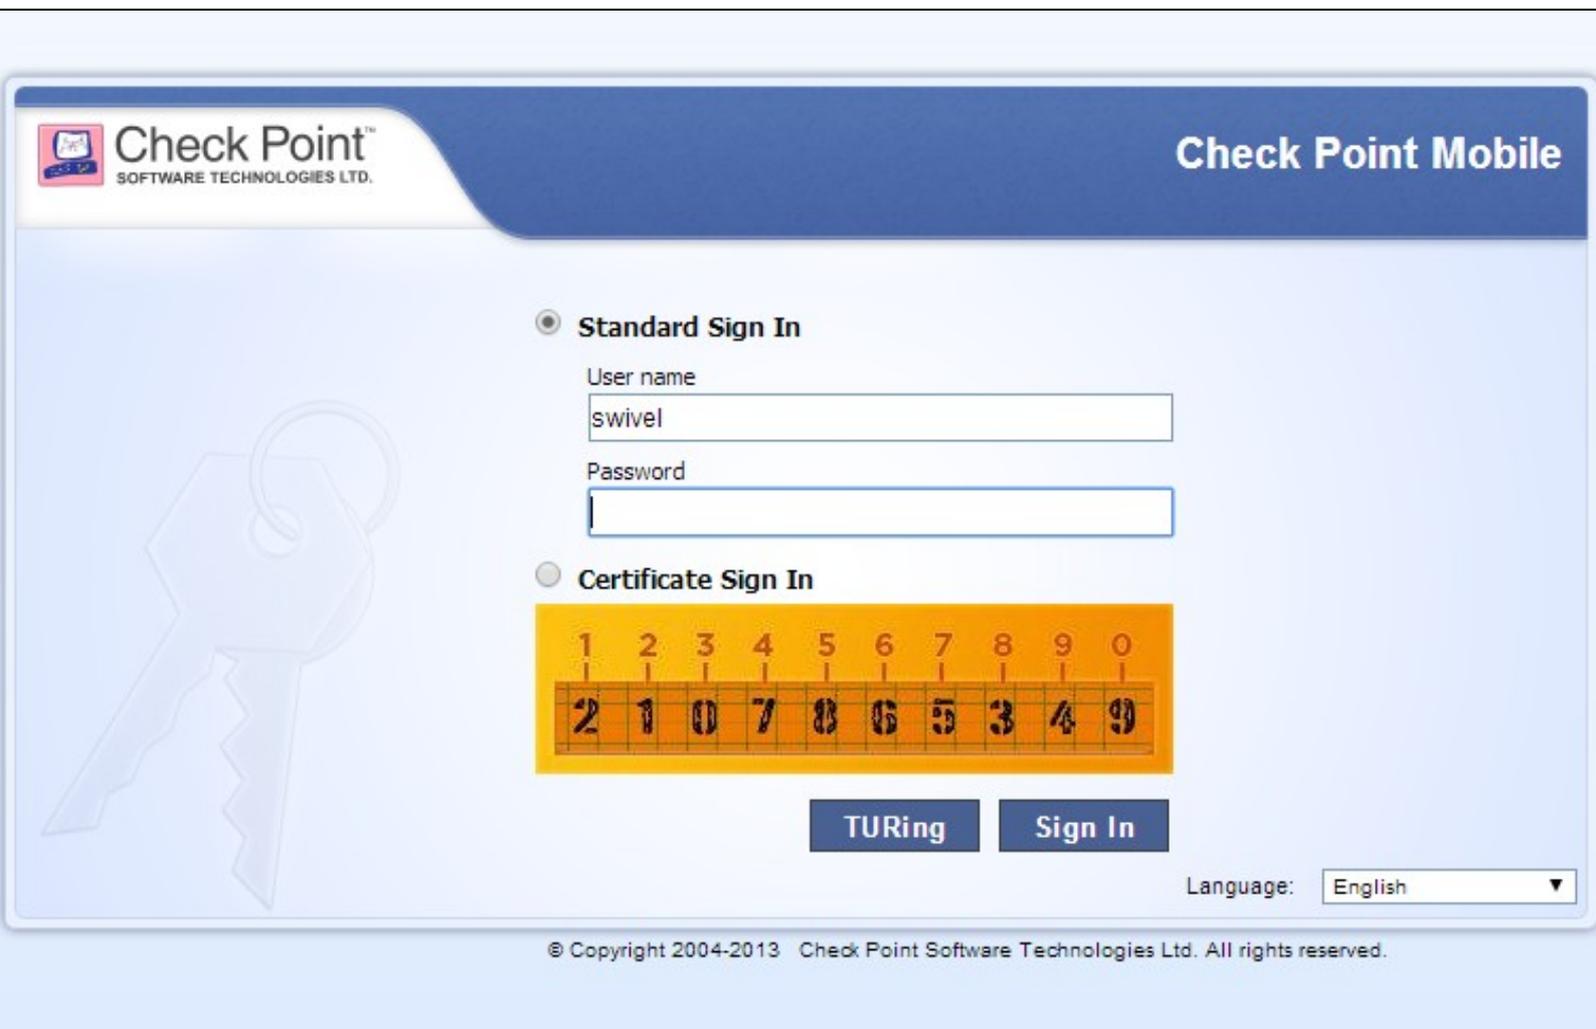

/opt/CPcvpn-R77/phpincs (note: the exact directory name CPcvpn-R** will vary depending on the Mobile Access Blade revision number).

Upload new Login Page

Use WinSCP to upload a copy of the provided LoginPage.php to the appliance.

Testing

With the changes in place, when a user accesses the Connectra portal they will see the modified login page.

After entering their username and either tabbing away from the username field or clicking the TURING button they will be presented with a TURING image.

The Swivel log should record a session start for that user.

The user can then use their PIN to extract their one-time code and enter this to authenticate. The Swivel log show record the RADIUS dialogue associated with this authentication.

Troubleshooting

Check the Swivel logs for TURING images and RADIUS requests.
