## Overview

When a Dual Channel message is sent, PINsafe can display to the user a Confirmed image that tells the user the request has been received. This can be changed to a different message.

## Prerequisites

PINsafe 3.x

## Enabling or Disabling CONFIRMED Message

To Enable or Disable the dual channel CONFIRMED message, from the PINsafe administration console select Server/Dual Channel then set the **Confirmation image on message request:** to Yes or No as required. Default is Yes.

## Changing the Dual Channel Message

The dual channel message confirmation can be configured on the PINsafe server by editing the following file:

<path to Tomcat>\webapps\pinsafe\WEB-INF\languages\errors.en.xml

Change the value below the PhraseIdentifier for DC\_CONFIRMATION\_IMG\_TEXT between <PhraseContent> and </PhraseContent>

Example:

From:

```
<Phrase>
  <PhraseIdentifier>DC_CONFIRMATION_IMG_TEXT</PhraseIdentifier>
  <PhraseContent>CONFIRMED</PhraseContent>
</Phrase>
```

To:

```
<Phrase>
  <PhraseIdentifier>DC_CONFIRMATION_IMG_TEXT</PhraseIdentifier>
  <PhraseContent>My New Message</PhraseContent>
</Phrase>
```

After the changes have been made then restart Tomcat

## Testing

Request a dual channel image in a web browser from the PINsafe server:

For a Swivel virtual or hardware Appliance:

[http://pinsafe\\_server\\_ip:8443/proxy/DCMessage?username=test](http://pinsafe_server_ip:8443/proxy/DCMessage?username=test)

For a Software install:

[http://pinsafe\\_server\\_ip:8080/pinsafe/DCMessage?username=test](http://pinsafe_server_ip:8080/pinsafe/DCMessage?username=test)

The modified confirmation message should appear

## Troubleshooting

On the PINsafe administration console under Server/Dual Channel ensure session request by username is enabled

On the PINsafe administration console under Server/Dual Channel ensure On-Demand delivery is enabled or that standard delivery is off by using the On demand authentication by setting it to Yes.
