

# Swivel Core V4 Migration Menu

## Data

The screenshot shows the Swivel Core V4 Migration Menu. The left sidebar contains a navigation menu with the following items: Status, Log Viewer, Server, Policy, Logging, Messaging, Database, Mode, Repository, RADIUS, Migration (expanded), Data (selected), Appliance, OATH, Config Sync, Reporting, User Administration, Save Configuration, Upload Email Images, Administration Guide, and Logout. The main content area is titled "Migration / Data" and features a warning: "WARNING: Migrating data overwrites the target." Below the warning, it says "Please select the target database and enter the migration phrase to migrate data." The form includes a "Target database:" dropdown menu set to "Internal", an "Append to existing data:" dropdown menu set to "No", and a text input field labeled "Enter 'MIGRATE':" which is currently empty. At the bottom of the form are "Apply" and "Reset" buttons.

This feature allows data to be migrated from one database to another. It should be used with caution as it will overwrite any data on the target database. To use the facility ensure that you have all the required drivers loaded for the target database and that the target database has been created and is reachable from the Swivel server. Then select the target database from the drop-down menu, and type the word MIGRATE in the text field and hit the apply button. You should then check the logs to see if there were any errors encountered.
