# 1 Authentication Manager

## 2 SAML based Authentication

Swivel Secure is developing a new SAML integration provides a new range of capabilities that optimise the application of Swivel Authentication for accessing Cloud Applications.

This is now part of version 4 of the Swivel authentication platform, renamed as "Sentry". For more information, please see [Sentry User Guide](#).

These capabilities include

1. Adaptive, Risk-based authentication: Enforcing the appropriate level of authentication depending on various risk factors
2. Single-Sign-On across multiple cloud applications

The mechanism behind these capabilities is a points system. Points are awarded to a user for successful authentication but also for other factors such as their IP address, the time of day etc etc.

The number of points awarded for different forms of authentication can be varies as can the number of points required to access each service or application.

This means a completely customised and optimised authentication system can be deployed.

### **3 Prerequisites**

Swivel Version 3.10.3 or later

Swivel Authentication software (Product in development and not yet available)

## 4 Configuring the Swivel server

### 4.1 Configuring the Swivel Agent

On the Swivel Administration console configure the Swivel Agent, see [Agents How to Guide](#). By default there is a local Agent, and if the Authentication manager and Swivel are on the server it can use this.

#### 4.1.1 Enabling Session creation with username

To allow the [TURing](#) image, [Pinpad](#) and other single channel images, under Server/Single Channel set [Allow session request by username](#) to Yes.

### 4.2 Configuring the Admin login

An Administrator account is required to login who is a member of the PINsafeAdministrators group, or group as defined below.

## 5 Authentication Manager Installation on a Swivel Appliance

The software comes as a web-archive (.war) file called swivelauthenticationmanager.war. Using [WinSCP](#) or similar copy the swivelauthenticationmanager.war file to /usr/local/tomcat/webapps2 folder.

This should automatically create the following folders:

```
/usr/local/tomcat/swivelauthenticationmanager
```

```
/home/swivel/.swivel/db/SwivelAuthenticationManagerDB
```

### 5.1 Configuring the Swivel Authentication Settings

Edit the settings.properties file in

```
/usr/local/tomcat/swivelauthenticationmanager/classes/settings.properties
```

The following values should be set for a Swivel hardware or virtual appliance:

```
pinsafessl=false
pinsafeserver=localhost
pinsafecontext=pinsafe
pinsafesecret=secret
pinsafeport=8181
imagesssl=true
imageserver=Swivel_DNS_Public_Name
imagecontext=proxy
imageport=8443
selfsigned=true
certificateIssuer=SAML_SP
encryptionType=DSA
publicKeyFilePath=/keys/pinsafe/ssl/dsapubkey.der
privateKeyFilePath=/keys/pinsafe/ssl/dsaprivkey.der
certificateFilePath=/keys/pinsafe/ssl/dsacert.pem
administrationGroup=PINsafeAdministrators
timeoutPolling=60000
```

Note: Sentry's administrationGroup by default is set to Swivel Admin, after a migration this group must match the admin group set in the core, which by default was PINsafeAdministrators.

After saving the settings restart Tomcat, such as through the [CMI](#)

**If you have changed the shared-secret for the local agent on the Swivel core server you need to set the secret on the authentication manager to match.**

**pinsafessl=false** True/False, Communication with the Swivel core, using SSL or not

**pinsafeserver=localhost** Communication with the Swivel core, localhost if installed on the same server

**pinsafecontext=pinsafe** Communication with the Swivel core, the Swivel installation name

**pinsafesecret=secret** Communication with the Swivel core, the shared secret defined on the core

**pinsafeport=8181** Communication with the Swivel core, port used for communication, 8181 for the proxy

**imagesssl=true** True/False Communication with the Swivel core, using SSL for images

**imageserver=Swivel\_DNS\_Public\_Name** Communication with the Swivel core, The IP address used for Swivel images and usually publicly available through the Swivel proxy

**imagecontext=proxy** Communication with the Swivel core, for obtaining authentication images, use proxy for an appliance

**imageport=8443** Communication with the Swivel core, for obtaining authentication images, use 8443 for an appliance

**selfsigned=true** True/False Communication with the Swivel core, for obtaining authentication images, True to allow self signed certificates

**certificateIssuer=SAML\_SP**

**encryptionType=DSA**

**publicKeyFilePath=/keys/pinsafe/ssl/dsapubkey.der**

**privateKeyFilePath=/keys/pinsafe/ssl/dsaprivkey.der**

**certificateFilePath=/keys/pinsafe/ssl/dsacert.pem**

**administrationGroup=PINsafeAdministrators**

**timeoutPolling=60000**

#### 5.1.1 Additional settings

**federatedIDAttribute=email** The Federated ID Attribute can be defined, if it is not specified, it defaults to email.

## 5.2 Key and Certificate generation

Key and Certificate Generation

## 5.3 Swivel Authentication Manager Login

Using a web browser connect to the Swivel Authentication Manager:

[https://IP\\_or\\_Hostname:8443/swivelauthenticationmanager](https://IP_or_Hostname:8443/swivelauthenticationmanager)

Login with a user who is a member of the administrationGroup on the Swivel server, the default value for this is administrationGroup=PINsafeAdministrators, which is the default Swivel Administrators group.

Administrative login can also be restricted by IP source, see [Filter IP How to Guide](#).

## Swivel Authentication Manager Login

**Username:**

**Password:**

**OTC:**

Login

Refresh Image

## Swivel Authentication Manager Login

**Username:**

admin

**Password:**

**OTC:**

Login

|   |   |   |   |
|---|---|---|---|
| 1 | 2 | 3 | 4 |
| 6 | 9 | 3 | 7 |

A successful login should load the Swivel Authentication manager default page:

- ▶ Type Rules
- ▶ Applications
- ▶ Users
- ▶ Authentication Methods
- ▶ Generate Idp metadata
- ▶ Logging Configuration
- ▶ View Log

## Swivel Authentication

The Swivel Authentication Manager allows authentication through the use of rules.

### 5.4 Integration

Integration of SAML-enabled services and applications will depend in detail on the applications themselves. However on the Authentication Manager side of the integration you need to

- 1) Give the service provider a name.
  - 2) State the number of points required before the user can gain access.
  - 3) The IP address or host name of the cloud service, specifically the SAML2.0 Endpoint for the service
  - 4) The cloud service URN, this will be part of the SAML Assertion that the cloud service will send
- If required the Authentication Manager's metadata can be generated by using the Generate IdP metadata function.

### 5.5 Authentication Methods

- ▶ Type Rules
- ▶ Applications
- ▶ Users
- ▶ Authentication Methods
- ▶ Generate Idp metadata
- ▶ Logging Configuration
- ▶ View Log

## Authentication Methods

| Description           | Score When Successful |
|-----------------------|-----------------------|
| Turing                | 50                    |
| Username and Password | 20                    |
| Soft Token            | 100                   |

In order for a user to be allowed access to the cloud applications they must attain a significant number of points. Points can be attained by "rules" or by successfully authenticating to the Authentication Manager

The number of points awarded for each for of authentication is defined on the Authentication Methods Screen.

### 5.6 Rules

- ▶ Type Rules
- ▶ Applications
- ▶ Users
- ▶ Authentication Methods
- ▶ Generate Idp metadata
- ▶ Logging Configuration
- ▶ View Log

## Rules

| ID | Type Rule        |                      |
|----|------------------|----------------------|
| 0  | IP Range         | <a href="#">View</a> |
| 1  | Time Range       | <a href="#">View</a> |
| 2  | Certificate      | <a href="#">View</a> |
| 3  | Group Membership | <a href="#">View</a> |

Rules are the means by which the system administrator can take into account a number of risk factors into account when deciding how a user should authenticate. The admin specifies the rule and then how many points the user is awarded (or penalised) should the rule be true for that user.

- ▶ Type Rules
- ▶ Applications
- ▶ Users
- ▶ Authentication Methods
- ▶ Generate Idp metadata
- ▶ Logging Configuration
- ▶ View Log

## IP Range Rules

| Description      | Score When Valid |                      |
|------------------|------------------|----------------------|
| Internal Network | 50               | <a href="#">Edit</a> |
| Regional Office  | 20               | <a href="#">Edit</a> |

For example a user accessing from the local office network may be deemed to be less risky than from other IP addresses and therefore a rule may be defined that awards 50 points to a user that is accessing from the office.

New Rules are being made available all the time. The current list of rules includes

### 5.6.1 IP address

If the user's IP address falls within a given range or ranges (since June 2014)

### 5.6.2 Time of Day

Points awarded (or subtracted) if the authentication takes place within a given time period (since June 2014)

### 5.6.3 X509 Certificate

Points awarded if the user has a valid X509 client installed on their computer (since July 2014)

### 5.6.4 Group Membership

Points awarded (or subtracted) if the user is a member of a defined group (eg Active Directory group) of users (since Sept 2014)

### 5.6.5 Known IP Address

Points awarded to a user if they are authenticating from an IP address from which they have previously successfully authenticated from (Due Dec 2014)

### 5.6.6 Location (Geo-IP)

Points awarded (or subtracted) based on a user's location as derived from their IP address(Due Q1 2015)

## 5.7 Users

Shows users who have made a log in displaying the following information:

Username  
Points  
Federated ID  
IP  
Applications

## 5.8 Logging

### 5.8.1 Logging Configuration

**Log Level:** default TRACE, options TRACE, DEBUG, ERROR, WARN, FATAL, The level to log, logs everything below the selected list

### 5.8.2 View Log

This Displays the Swivel Authentication manager login

**Events Per Page:** default 10, The number of events to display per page

**Page Number:** default 1, The page number of logs to display

**Log Level:** default TRACE, options TRACE, DEBUG, ERROR, WARN, FATAL, The log level to show, displays everything below the selected list

**Ascending Date Order:** default not ticked, Show as Ascending or descending date

## 5.9 Logging Out

The Authentication manager will remember a users session for a period of time, not requiring them to login, unless a logout option has been enabled. For testing purposes it is useful to logout when the option is not available, and this can be done by deleting cookies, or some browsers such as firefox allow individual cookies to be deleted or removing them form the file system. The cookie name is usually that of the Authentication Manager URL.

## 6 Testing

## 7 Known Issues

## 8 Troubleshooting

Check the Authentication Manager logs, the Swivel Administration Console logs and the Tomcat logs for any error messages

Swivel appliances `/var/log/tomcat/catalina.out`

No Username entered, or the application does not have permission. Check the logs.

## Swivel Authentication Manager Login

Access Denied

**Username:**

**Password:**

**OTC:**

Login

Refresh Image

Administrative User cannot login

This is usually the admin user and by default on the Swivel core, they must be a member of the Swivel Repository Group PINsafeAdministrators, unless a different setting is configured in the settings.properties file, the default is: administrationGroup=PINsafeAdministrators. If it is different the Swivel core

will show a successful authentication, but the Authentication Manager fails due to the incorrect group.

#### Sample Swivel core login information

```
Primary:Read user: admin.  
Searching encryption key for the IP: 192.168.12.110, agent name found: Primary  
Primary>Login successful for user: admin.  
Primary:Processing user admin as channel SINGLE
```

## 8.1 Error Messages

### Authentication failed for username:

The login attempt failed for the user

### Cannot find application for URN:

The application is not configured for authentication, check the Application settings. The URN is supplied to the Authentication manager, and check against the configured applications to find a matching Entity ID. To have the rule match a particular application set the Entity ID to the URN.

### No LoggedUser in session, directing to username page

The user has not logged in so is directed to the authentication page.

### Error XBM0H: Directory /home/swivel/SwivelAuthenticationManagerDB cannot be created.

### java.lang.OutOfMemoryError: PermGen space

### "ActiveMQ ShutdownHook" java.lang.OutOfMemoryError: PermGen space

These errors have been seen when there has not been enough memory available to run the Swivel Authentication Manager. See [Heap Space Memory Management How to guide](#).

## 9 Google Apps Integration

## 10 Using Swivel for Google Apps Authentication

GoogleApps is a Software-as-a-Service approach to email, calendars and online document sharing. Swivel can provide Two Factor authentication with SMS, Token, Mobile Phone Client and strong Single Channel Authentication TURing, Pinpad or in the Taskbar using RADIUS.

Organisations can configure their GoogleApps domain to use single-sign-on (SSO), all users in the domain are required to use the Swivel authentication, although with the Authentication Manager it is possible for Swivel to log users in to other applications. This means that rather than supply GoogleApps with a username/password, you configure GoogleApps to refer to an authentication portal to authenticate the user. The portal collects and checks the users credentials and passes back the result of the authentication to GoogleApps.

This document describes how Swivel can be configured to act as the authentication portal for GoogleApps.

## 11 Prerequisites

Swivel authentication platform 3.x

Google account

The authentication page must be placed in a location that can be accessed through the internet, usually by using a NAT to a Swivel virtual or hardware appliance.

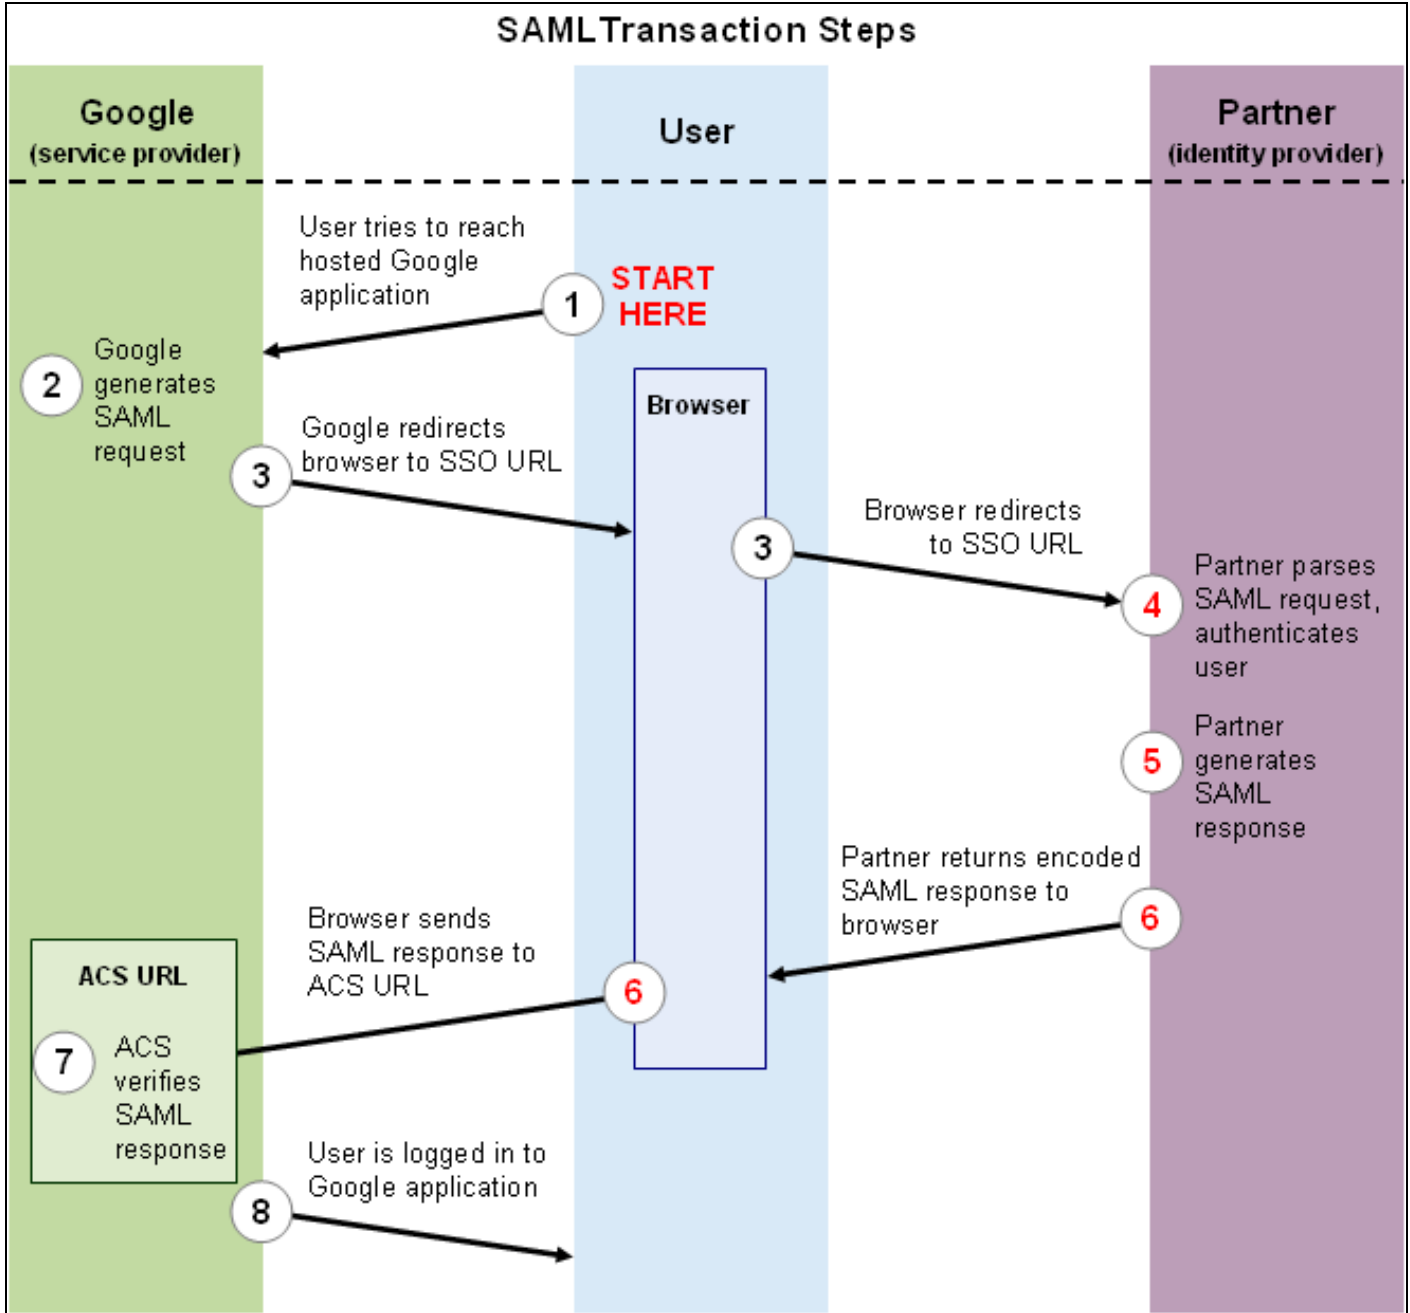

[Swivel Google Authentication Portal](#).

## 12 Google SSO

The diagram below is taken from [Google Apps reference site](#)

When a user attempts to access a Google Apps application Google Apps will look for the presence of a cookie that indicates that the user is an authenticated user. If that cookie is not present the user is redirected to the Partner (Identity Provider) Site.

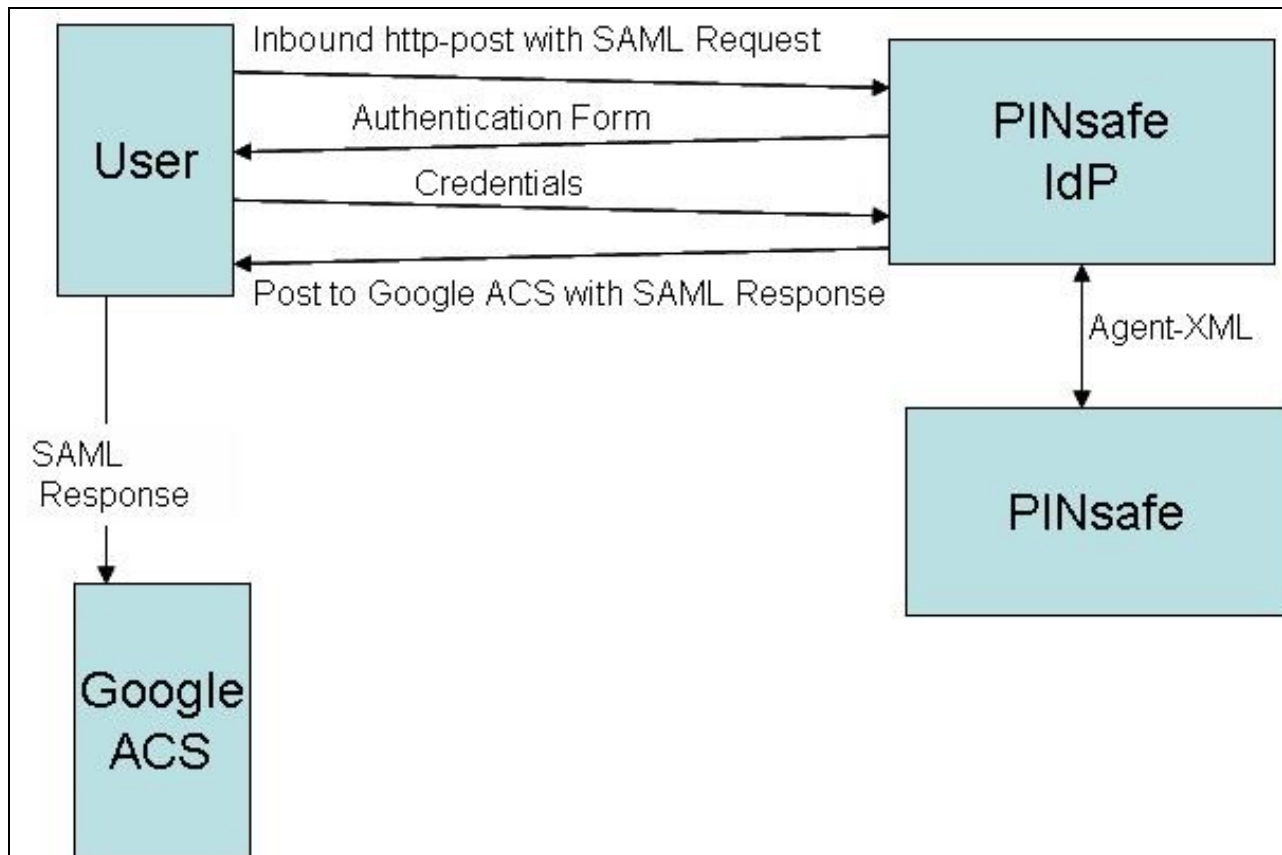

That redirect will include a SAML request. The request includes the url of the Google Apps ACS (Assertion Consumer Service). This is the Google Apps Service that controls access to Google Apps

The Identity Provider (IdP) authenticates the user. If the authentication is successful it creates a SAML response and posts that response to the url of the Google Apps ACS that it was passed in the SAML request. The ACS then allows the user access as appropriate.

## 13 Swivel and Google Apps

Swivel has its own XML-based API that it uses for authentication. There is now an external Swivel application that can interpret the inbound SAML request, carry out a standard Swivel authentication via Agent-XML and then post the associated SAML response.

This application needs to be publicly accessible so that users can authenticate to it, it also needs to be configured as an agent on a Swivel server. More detailed configuration information appears later in this document.

## 14 User Experience

The user opens a browser and accesses googleApps e.g. <http://mail.google.com/a/swivelsecure.net> this is then redirected in a new URL includes the encrypted SAML request.

What the user sees is a login page familiar to Swivel users. This page can be modified depending on the form of Swivel authentication required. The user authenticates to this form in the same way as any other Swivel authentication form.

Swivel login page

The image shows a screenshot of the Swivel login page. At the top left is the Swivel logo, which consists of a stylized 'S' made of yellow and orange blocks, followed by the word 'SWIVEL' in bold black letters and the tagline 'the power of knowing' in orange. Below the logo are three input fields: 'Username:', 'Password:', and 'OTC:'. Each field is a simple white rectangle with a thin border. At the bottom of the form are two buttons: a blue 'Login' button and a red 'Refresh Image' button.

Dual Channel Authentication

**Username:**

user@domain.com

**Password:**

•••••

**OTC:**

## 15 Install the Swivel Google software

This is usually deployed on the Swivel server, but may be deployed within a Java container such as Apache Tomcat on another server. In HA deployments with multiple Swivel instances, the Software can be deployed in each instance.

Swivel virtual or hardware appliances: Use [WinSCP](#) to copy the AuthenticationPortal-google.war file to /usr/local/tomcat/webapps2

Software installs and older virtual or hardware appliances: copy the AuthenticationPortal-google.war file to the webapps folder of the Apache Tomcat installation.

The google software should create a AuthenticationPortal-google folder.

## 16 Create private keys and certificates

Communication between Google and the Swivel instance is secure through the use of certificates.

### 16.1 Creating DSA Private Key

DSA key generation involves two steps, and can be done through the command line on a Swivel virtual or hardware appliance:

1.

```
openssl dsaparam -out dsaparam.pem 2048
```

2.

```
openssl gendsa -out dsaprivkey.pem dsaparam.pem
```

The first step creates a DSA parameter file, `dsaparam.pem`, which in this case instructs OpenSSL to create a 2048-bit key in Step 2. The `dsaparam.pem` file is not itself a key, and can be discarded after the public and private keys are created. The second step actually creates the private key in the file `dsaprivkey.pem` which should be kept secret.

Export the key into a DER (binary) format. You can do so with the following steps:

1.

```
openssl dsa -in dsaprivkey.pem -outform DER -pubout -out dsapubkey.der
```

2.

```
openssl pkcs8 -topk8 -inform PEM -outform DER -in dsaprivkey.pem -out dsaprivkey.der -nocrypt
```

Step 1 extracts the public key into a DER format. Step 2 converts the private key into the pkcs8 and DER format. Once you've done this, you can use this public (`dsapubkey.der`) and private (`dsaprivkey.der`) key pair.

### 16.2 Creating a Certificate

Once you have your key pair, it's easy to create an X.509 certificate. The certificate holds the corresponding public key, along with some metadata relating to the organization that created the certificate. Follow this step to create a self-signed certificate from either an RSA or DSA private key:

```
openssl req -new -x509 -key dsaprivkey.pem -out dsacert.pem
```

After you answer a number of questions, the certificate will be created and saved as `dsacert.pem`.

The created keys, `dsapubkey.der` and `dsaprivkey.der` need to be copied to the keys folder or wherever specified within `settings.xml`

The **dsacert.pem** certificate needs to be uploaded to the GoogleApps server.

## 17 Configure the Google Swivel install

Edit the AuthenticationPortal-google\WEB-INF\settings.xml file.

**pinsafessl** default: false - To use SSL communications on the pinsafeport set this to TRUE, to use without SSL set this to False.

**pinsafeserver** default: adouglas.swivelsecure.net - The hostname or IP address of the Swivel server.

**pinsafecontext** default: pinsafe - The installation name of the Swivel application.

**pinsafesecret** default: secret - The shared secret configured on the Swivel server.

**pinsafeport** default: 8080 - The communication port for the Swivel server.

**imagesssl** default: false - To use SSL communications on the imageserver port set this to TRUE, to use without SSL set this to False.

**imageserver** default: adouglas.swivelsecure.net - The hostname or IP address used for retrieving images from the Swivel server. This must be contactable from the internet.

**imagecontext** default: pinsafe - The Swivel installation name used for retrieving images from the Swivel server. For virtual or hardware appliances this is usually *proxy*. For Software installations this is usually *pinsafe*.

**imageport** default: 8080 - The port used for retrieving images from the Swivel server. For virtual or hardware appliances this is usually 8443. For a software only install see [Software Only Installation](#).

**selfsigned** default: true - To use SSL communications on the imageserver port with a self signed or invalid certificate set this to TRUE, to use without only the correct SSL certificate set this to False.

**certificateIssuer** default: SwivelSecure

**publicKeyFilePath** default: /keys/pinsafe/robssl/dsapubkey.der

**privateKeyFilePath** default: /keys/pinsafe/robssl/dsaprivkey.der

**certificateFilePath** default: /keys/pinsafe/robssl/dsacert.pem

## 18 Writing the configuration data

From a web browser run the following:

For a virtual or hardware appliance

[https://Swivel\\_google\\_server:8443/AuthenticationPortal-google/configuration.jsp](https://Swivel_google_server:8443/AuthenticationPortal-google/configuration.jsp)

For a software only install see [Software Only Installation](#)

Click on the Generate *Idp Metadata* button.

The *Idp WS-Metadata* button is provided for future enhancements and is not currently used.

This will then generate Metadata files.

Example:

Swivel Virtual Appliance or hardware Appliance:

Metadata successfully written to /usr/local/tomcat/webapps2/AuthenticationPortal-google/generatedIdPMetadata.xml

Software installation:

Metadata successfully written to C:\Program Files (x86)\Apache Software Foundation\Tomcat 6.0\webapps\AuthenticationPortal-google\generatedIdPMetadata.xml

### 18.1 Configuring Swivel for Agent XML Authentication

The IdP is usually deployed on the Swivel hardware or virtual appliance, and a default localhost Agent is usually pre-configured. To make any changes to this see [Agents How to Guide](#)

### 18.2 Configuring Swivel for Single Channel Images

If Swivel Single Channel images are to be used for authentication, then the following guide can be used.

[Single Channel How To Guide](#)

### 18.3 Configuring Swivel for Dual Channel Authentication

If Swivel Dual Channel authentication methods are to be used, refer to the following guide:

[Transport Configuration](#)

## 19 Configuring Google Apps to use the Swivel IdP

To set GoogleApps to use the Swivel IdP you need to configure the service from the Google Apps admin console.

The settings are under: Security, Advanced settings -> Set up single sign-on (SSO).

### Set up single sign-on (SSO)

To set up SSO, please provide the information below. [SSO Reference](#)

Enable Single Sign-on

#### Sign-in page URL \*

URL for signing in to your system and Google Apps

#### Sign-out page URL \*

URL to redirect users to when they sign out

#### Change password URL \*

URL to let users change their password in your system

#### Verification certificate \*

A certificate file has been uploaded-[Replace certificate](#)

The certificate file must contain the public key for Google to verify sign-in requests. [Learn more](#)

You need to enter the public IP address of the Swivel IdP, including the port number and upload the certificate generated in the previous section.

**You will need to include the port numbers of the Idp unless you have configured the virtual or hardware appliance firewall (see [How to run PINsafe on non-default ports](#)) to map port 80 to the port the Idp is listening on**

The **dsacert.pem** certificate needs to be uploaded to the GoogleApps server. If the existing certificate is being replaced and clicking to **Replace certificate** is not working, try in Chrome or Safari web browsers.

## 20 Testing

Browse to the Swivel Google login page to check that it is working:

Swivel virtual or hardware appliance install: [https://swivel\\_appliance:8443/AuthenticationPortal-google/identity\\_provider.jsp](https://swivel_appliance:8443/AuthenticationPortal-google/identity_provider.jsp)

For a software only install see [Software Only Installation](#)

If these work then browse to the google login page, the browser should be directed to a sign-in page. This page is the Swivel IdP. The url is something like:

```
http://<idp IP address>/pinsafeldp.jsp?SAMLRequest=fVLJTSMwEL0j8Q%2BW79kqKiGrCSpFiEosEQ0cuDnOpHXxEjxOA3%2BPm
4KAA72%2BmXnLzMwu3rUiO3AorclpFqeUgBG2kWad06fqOjqnF8XpyQy5Vh2b935jHuGtB%2FQkTBpkYyGnvTPMcpTIDNeAzAu2mt
%2Fdskmcss5Zb4VVICyvcmbjvkV1FKDsOZVSWj0tjU1r7fbRnMtTVivBKwpef62NdnbWiL2sDToufEBSrM0SqdrNqmyKUvP2dn0h
ZLyS%2BISmkOCY7bqQxOym6oqo%2FJhVY0EO9mAuw%2FdOV1bu1YQC6v38iVHILsAt1whUDJHBOeDwYU12GtwK3A7KeDp8TanG%2B

7%2FV8vibERkE7VjK%2BsNdiBkG65HSVlCVP8%2BShibTw%3D%3D&RelayState=https%3A%2F%2Fwww.google.com%2Fa%2F
swivelsecure.net%2FServiceLogin%3Fservice%3Dmail%26passive%3Dtrue%26rm%3Dfalse%26continue%3Dhttp%253A
%252F%252Fmail.google.com%252Fa%252Fswivelsecure.net%252F%26bsv%3D1eic6yu9oa4y3%26tmpl%3Ddefault%26tmpcache%3D2
```

## 21 Troubleshooting

Check the Swivel logs.

The Tomcat catalina.out file will display error messages relating to creation of the Meta Data.

Virtual or hardware appliance : /var/logs/tomcat/catalina.out

### 21.1 Error Messages

**This account cannot be accessed because the login credentials could not be verified.**

**We are unable to process your request at this time, please try again later.**

The certificates, address or ports may be incorrect.

**Login Failed: Invalid user.**

Verify the username used is present on the Swivel instance. Check the Swivel logs for failed authentications.

## 22 Google Docs Integration

See [Google Apps Integration](#)

## 23 Huddle

WORK IN PROGRESS PLEASE CONTACT SWIVEL IF YOU REQUIRE THIS INTEGRATION

## 24 Overview

Huddle is a content management and enterprise collaboration in the cloud. This document outlines how to add Swivel Two factor and strong authentication. When a user browses to their huddle account example: <https://swivelsecure.huddle.net/> they are redirected to the Swivel login page for authentication.

## 25 Prerequisites

Swivel authentication platform 3.x

Huddle account

The authentication page must be placed in a location that can be accessed through the internet, usually by using a NAT to a Swivel appliance.

### 25.1 Downloads

AuthenticationPortal-huddle.war software

## 26 Baseline

(The version tested with)

Swivel authentication platform 3.9.5

## 27 Architecture

## 28 Installation

### 28.1 Configure The Swivel Server

#### Configure a Swivel Agent (For standard XML Authentication)

1. On the Swivel Management Console select Server/Agent
2. Enter a name for the Agent
3. Enter the Exchange IP address
4. Enter the shared secret used above on the Exchange Filter
5. Click on Apply to save changes

|         |                       |  |                                       |
|---------|-----------------------|--|---------------------------------------|
| Agents: | Name:                 | <input type="text" value="local"/>       |                                       |
|         | Hostname/IP:          | <input type="text" value="127.0.0.1"/>   |                                       |
|         | Shared secret:        | <input type="password" value="....."/>   |                                       |
|         | Group:                | <input type="text" value="---ANY---"/>   |                                       |
|         | Authentication Modes: | <input type="text" value="ALL"/>         | <input type="button" value="Delete"/> |
|         |                       |  |                                       |
|         | Name:                 | <input type="text" value="IIS"/>         |                                       |
|         | Hostname/IP:          | <input type="text" value="192.168.1.1"/> |                                       |
|         | Shared secret:        | <input type="password" value="....."/>   |                                       |
|         | Group:                | <input type="text" value="---ANY---"/>   |                                       |
|         | Authentication Modes: | <input type="text" value="ALL"/>         | <input type="button" value="Delete"/> |

#### Configure Single Channel Access

1. On the Swivel Management Console select Server/Single Channel
2. Ensure ?Allow session request by username? is set to YES

## Server>Single Channel

Please specify how single channel security strings are delivered.

|   |   |
|---|---|
| Image file:   | <input type="text" value="turing.xml"/> |
| Rotate letters:   | <input type="text" value="No"/>         |
| Allow session request by username:  | <input type="text" value="Yes"/>        |
| Only use one font per image:  | <input type="text" value="Yes"/>        |
| Jiggle characters within slot:  | <input type="text" value="No"/>         |
| Add blank trailer frame to animated images:                               | <input type="text" value="Yes"/>        |
| Text Alpha Value:   | <input type="text" value="80"/>         |
| Number of complete display cycles per image:                              | <input type="text" value="10"/>         |
| Inter-frame delay (1/100s):   | <input type="text" value="40"/>         |
| Image Rendering:  | <input type="text" value="Static"/>     |
| Multiple AUTHentications per String:                                      | <input type="text" value="No"/>         |
| Generate animated images:   | <input type="text" value="No"/>         |
| Random glyph order when animating:  | <input type="text" value="No"/>         |
| No. Characters Visible:   | <input type="text" value="1"/>          |
| <input type="button" value="Apply"/> <input type="button" value="Reset"/> |   |

### 28.2 Using additional attributes for authentication

When using additional attributes for authentication see [User Attributes How To](#)

### 28.3 Install the Swivel Huddle software

This is usually deployed on the Swivel server, but may be deployed within a Java container such as Apache Tomcat on another server. In HA deployments with multiple Swivel instances, the Software can be deployed in each instance.

Swivel appliances: Use [WinSCP](#) to copy the AuthenticationPortal-huddle.war file to /usr/local/tomcat/webapps2

Software installs and older appliances: copy the AuthenticationPortal-huddle.war file to the webapps folder of the Apache Tomcat installation.

The huddle software should create a AuthenticationPortal-huddle folder.

## 28.4 Create private keys and certificates

Communication between Huddle and the Swivel instance is secure through the use of certificates.

### 28.4.1 Creating DSA Private Key

DSA key generation is given below, and can be done through the command line on a Swivel appliance:

1. Create a DSA parameter file, `dsaparam.pem`, which in this case instructs OpenSSL to create a 1024-bit key. The `dsaparam.pem` file is not itself a key, and can be discarded after the public and private keys are created.

```
openssl dsaparam -out dsaparam.pem 1024
```

2. create a private key in the file `dsaprivkey.pem` which should be kept secret.

```
openssl gendsa -out dsaprivkey.pem dsaparam.pem
```

3. Export the key into a DER (binary) format.

```
openssl dsa -in dsaprivkey.pem -outform DER -pubout -out dsapubkey.der
```

4. Convert the private key into the pkcs8 and DER format. Once you've done this, you can use this public (`dsapubkey.der`) and private (`dsaprivkey.der`) key pair.

```
openssl pkcs8 -topk8 -inform PEM -outform DER -in dsaprivkey.pem -out dsaprivkey.der -nocrypt
```

### 28.4.2 Creating a Certificate

Once you have your key pair, it's easy to create an X.509 certificate. The certificate holds the corresponding public key, along with some metadata relating to the organization that created the certificate. Follow this step to create a self-signed certificate from either an RSA or DSA private key:

```
openssl req -new -x509 -key dsaprivkey.pem -out dsacert.pem
```

After you answer a number of questions, the certificate will be created and saved as `dsacert.pem`. The created keys, `dsapubkey.der` and `dsaprivkey.der` need to be copied to the keys folder or wherever specified within `settings.xml`

The `dsacert.pem` certificate needs to be sent to the Huddle team, see below.

## 28.5 Configure the Huddle Swivel install

Edit the `AuthenticationPortal-huddle\WEB-INF\settings.xml` file.

**pinsafessl** default: false, To use SSL communications on the pinsafeport set this to TRUE, to use without SSL set this to False.

**pinsafeserver** default: `adouglas.swivelsecure.net`, The hostname or IP address of the Swivel server.

**pinsafecontext** default: `pinsafe`, The installation name of the Swivel application.

**pinsafesecret** default: `secret`, The shared secret configured on the Swivel server.

**pinsafeport** default: 8080, The communication port for the Swivel server.

**imagesssl** default: false, To use SSL communications on the imageserver port set this to TRUE, to use without SSL set this to False.

**imageserver** default: `adouglas.swivelsecure.net`, The hostname or IP address used for retrieving images from the Swivel server. This must be contactable from the internet.

**imagecontext** default: `pinsafe`, The Swivel installation name used for retrieving images from the Swivel server. For appliances this is usually `proxy`. For Software installations this is usually `pinsafe`.

**imageport** default: 8080, The port used for retrieving images from the Swivel server. For appliances this is usually 8443. For a software only install see [Software Only Installation](#).

**selfsigned** default: true, To use SSL communications on the imageserver port with a self signed or invalid certificate set this to TRUE, to use without only the correct SSL certificate set this to False.

**certificateIssuer** default: `SwivelSecure`,

**publicKeyFilePath** default: `/keys/pinsafe/robssl/dsapubkey.der`,

**privateKeyFilePath** default: `/keys/pinsafe/robssl/dsaprivkey.der`,

**certificateFilePath** default: `/keys/pinsafe/robssl/dsacert.pem`,

## 28.6 Writing the configuration data

From a web browser run the following:

For an appliance

[https://Swivel\\_huddle\\_server:8443/AuthenticationPortal-huddle/configuration.jsp](https://Swivel_huddle_server:8443/AuthenticationPortal-huddle/configuration.jsp)

For a software only install see [Software Only Installation](#)

Click on the Generate *Idp Metadata* button.

The *Idp WS-Metadata* button is provided for future use.

This will then generate Metadata files.

Example:

Appliance:

Metadata successfully written to /usr/local/tomcat/webapps2/AuthenticationPortal-huddle/generatedIdPMetadata.xml

Software installation:

Metadata successfully written to C:\Program Files (x86)\Apache Software Foundation\Tomcat 6.0\webapps\AuthenticationPortal-huddle\generatedIdPMetadata.xml

## 28.7 Huddle Integration

Send the following files to the Huddle team [sales@huddle.com](mailto:sales@huddle.com) together with the company name:

dsacert.pem

generatedIdPMetadata.xml

## 28.8 Additional Installation Options

## 29 Testing the Installation

Browse to the Swivel huddle login page to check it is working:

Swivel appliance install: [https://swivel\\_appliance:8443/AuthenticationPortal-huddle/identity\\_provider.jsp](https://swivel_appliance:8443/AuthenticationPortal-huddle/identity_provider.jsp)

For a software only install see [Software Only Installation](#)

Swivel login page

A screenshot of the Swivel login page. At the top left is the Swivel logo, which consists of a stylized 'S' made of yellow and orange blocks, followed by the word 'SWIVEL' in large, bold, black letters, and the tagline 'the power of knowing' in smaller, orange letters below it. Below the logo are three input fields: 'Username:', 'Password:', and 'OTC:'. Each field is a simple rectangular box with a thin border. At the bottom of the form are two buttons: a blue button labeled 'Login' and a red button labeled 'Refresh Image'.

Dual Channel Authentication

**Username:**

user@domain.com

**Password:**

•••••

**OTC:**

••••|

Login

Refresh Image

Single Channel Authentication

**Username:**

**Password:**

**OTC:**

Login

Refresh Image

If these work then browse to the huddle login page which should redirect to the Swivel authentication page to give a login. Example: <https://swivelsecure.huddle.net/>

## 30 Uninstalling the Swivel Integration

## 31 Troubleshooting

Check the Swivel logs.

The Tomcat catalina.out file will display error messages relating to creation of the Meta Data.

Appliance : /var/logs/ctomcat/catalina.out

## 32 Known Issues and Limitations

## 33 Additional Information

For assistance in the Swivel installation and configuration please firstly contact your reseller and then email Swivel Secure support at [support@swivelsecure.com](mailto:support@swivelsecure.com).

## 34 Oracle WebLogic

## 35 Overview

This document outlines the integration of Oracle WebLogic with Swivel using SAML with Swivel as an Identity Provider (IdP). It assumes that the Identity Provider and SAML Swivel Demo app are installed on the same Swivel appliance.

Swivel can provide Two Factor authentication with SMS, Token, Mobile Phone Client and strong Single Channel Authentication TURing, Pinpad or in the Taskbar.

To use the Single Channel Image such as the TURing Image, the Swivel server must be made accessible. **The client requests the images from the Swivel server, and is usually configured using a NAT (Network Address Translation)**, often with a proxy server. The Swivel virtual appliance or hardware appliance is configured with a proxy port to allow an additional layer of protection.

## 36 Prerequisites

Oracle WebLogic

Swivel 3.9 onwards

[Swivel AuthenticationPortal.zip](#). The file containing the IdP and login page to authenticate using Swivel.

[Swivel SAMLswivelDemo.zip](#). A simple app which sits on the service provider server to demonstrate how a user needs to be authenticated.

## 37 Baseline

Swivel 3.9, 3.10

Oracle WebLogic 12.1.1

## 38 Architecture

Swivel is configured as an Identity Provider, see the following [Oracle Documentation](#).

## 39 Installation

To implement the solution there are several steps:

- Setup up the Identity Provider (IdP) (Authentication Portal)
- Generate the IdP metadata (which is used to create the relationship between the IdP and Service Provider).
- Setup the service provider (the federation service and its association with the Idp)
- Create a user within PINSafe and Weblogic
- Install the demonstration application
- Test the solution

### 39.1 Swivel Integration Configuration

#### 39.1.1 Configuring Swivel for Agent XML Authentication

The IdP is usually deployed on the Swivel hardware or virtual appliance, and a default localhost Agent is usually pre-configured. To make any changes to this see [Agents How to Guide](#)

#### 39.1.2 Configuring Swivel for Single Channel Images

If Swivel Single Channel images are to be used for authentication, then the following guide can be used.

[Single Channel How To Guide](#)

#### 39.1.3 Configuring Swivel for Dual Channel Authentication

If Swivel Dual Channel authentication methods are to be used, refer to the following guide:

[Transport Configuration](#)

### 39.2 Configuring the Swivel Authentication Portal

Download and extract the AuthenticationPortal.war file from the AuthenticationPortal.zip and copy this file using [WinSCP](#) to /usr/local/tomcat/webapps2 where a folder called AuthenticationPortal should appear.

Within the AuthenticationPortal folder, there will be folder called WEB-INF, with the settings.xml file (/usr/local/tomcat/webapps2/WEB-INF/settings.xml). Right click settings.xml and either Edit the file or Open in another editor such as Notepad++.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE properties SYSTEM "http://java.sun.com/dtd/properties.dtd">
<properties>
<entry key="pinsafessl">false</entry>
<entry key="pinsafeserver">localhost</entry>
<entry key="pinsafecontext">pinsafe</entry>
<entry key="pinsafesecret">secret</entry>
<entry key="pinsafeport">8080</entry>
<entry key="imagessl">false</entry>
<entry key="imageserver">localhost</entry>
<entry key="imagecontext">pinsafe</entry>
<entry key="imageport">8080</entry>
<entry key="selfsigned">>true</entry>
<entry key="serviceProviderEndpointURL">https://login.salesforce.com/?saml=02HKiPoin4nQspKPHoScmudQmsKtM.qRKnViSBCmh05IC52m5VptCNw0.p</entry>
<entry key="audience">https://saml.salesforce.com</entry>
<entry key="certificateIssuer">SAML_SP</entry>
<entry key="publicKeyFilePath">/keys/pinsafe/ssl/dsapubkey.der</entry>
<entry key="privateKeyFilePath">/keys/pinsafe/ssl/dsaprivkey.der</entry>
<entry key="certificateFilePath">/keys/pinsafe/ssl/dsacert.pem</entry>
</properties>
```

**pinsafessl** Communication between the IdP and Swivel. If SSL is used on the Swivel server set this to true, otherwise false. For a Swivel Hardware or Virtual appliance this should be changed to false when using port 8181 if Swivel is deployed in webapps2.

**pinsafeserver** Communication between the IdP and Swivel. Where the IdP is installed on the same server as Swivel this should be set to localhost.

**pinsafecontext** Communication between the IdP and Swivel. This is the install context and is usually pinsafe.

**pinsafesecret** Communication between the IdP and Swivel. By default a Swivel hardware or virtual appliance uses this value as the shared secret.

**pinsafeport** Communication port between the IdP and Swivel. For a Swivel Hardware or Virtual appliance this should be changed to 8181 if Swivel is deployed in webapps2 and uses a non SSL connection.

**imagessl** Communication between the IdP and User. If SSL is used on the Swivel server set this to true, otherwise false.

**imageserver** Communication between the IdP and User. If SSL is used on the Swivel server set this to true, otherwise false. By default a Swivel hardware or virtual appliance uses SSL.

**imagecontext** Communication between the IdP and User. This is the install context and is usually pinsafe.

**imageport** Communication between the IdP and User. For a Swivel Hardware or Virtual appliance this should be changed to 8443 although 443 or other port can also be used.

**selfsigned** Communication between the IdP and User. If SSL is used on the Swivel server with a self signed certificate then set this to true, otherwise false. By default a Swivel hardware or virtual appliance uses SSL with a self signed certificate.

**serviceProviderEndpointURL** the Published Site URL, defined in Setting up the Service Provider. Example:<https://192.168.10.10/saml2>

**audience**

**certificateIssuer** SAML\_SP

**publicKeyFilePath** path to the public key usually /keys/pinsafe/ssl/dsapubkey.der

**privateKeyFilePath** path to the private key usually /keys/pinsafe/ssl/dsaprivkey.der

**certificateFilePath** path to the certificate usually /keys/pinsafe/ssl/dsacert.pem

## 39.3 Create private keys and certificates

Communication between Oracle and the Swivel instance is secure through the use of certificates.

### 39.3.1 Creating DSA Private Key

DSA key generation involves two steps, and can be done through the command line on a Swivel virtual appliance or hardware appliance:

1.

```
openssl dsaparam -out dsaparam.pem 2048
```

2.

```
openssl gendsa -out dsaprivkey.pem dsaparam.pem
```

The first step creates a DSA parameter file, dsaparam.pem, which in this case instructs OpenSSL to create a 2048-bit key in Step 2. The dsaparam.pem file is not itself a key, and can be discarded after the public and private keys are created. The second step actually creates the private key in the file dsaprivkey.pem which should be kept secret.

Export the key into a DER (binary) format. You can do so with the following steps:

1.

```
openssl dsa -in dsaprivkey.pem -outform DER -pubout -out dsapubkey.der
```

2.

```
openssl pkcs8 -topk8 -inform PEM -outform DER -in dsaprivkey.pem -out dsaprivkey.der -nocrypt
```

Step 1 extracts the public key into a DER format. Step 2 converts the private key into the pkcs8 and DER format. Once you've done this, you can use this public (dsapubkey.der) and private (dsaprivkey.der) key pair.

### 39.3.2 Creating a Certificate

Once you have your key pair, it's easy to create an X.509 certificate. The certificate holds the corresponding public key, along with some metadata relating to the organization that created the certificate. Follow this step to create a self-signed certificate from either an RSA or DSA private key:

```
openssl req -new -x509 -key dsaprivkey.pem -out dsacert.pem
```

After you answer a number of questions, the certificate will be created and saved as dsacert.pem.

The created keys, dsapubkey.der and dsaprivkey.der need to be copied to the keys folder or wherever specified within settings.xml

The **dsacert.pem** certificate needs to be uploaded to the GoogleApps server.

## 39.4 Generating IdP metadata

SAML metadata is generated by the IdP to simplify the mapping process between itself and the Service Provider.

The AuthenticationPortal folder should be located under /usr/local/tomcat/webapps2. In order to gain access to the Authentication Portal webpage, you must navigate to <https://<IPAddress>:8443/AuthenticationPortal/configuration.jsp>. (case sensitive).

This will display the configuration page as shown below. From here you should press ?Generate Idp Metadata?.

If successful, the metadata will be written to the root of the web application with the message "Metadata successfully written to" and the full path and filename displayed. Make a note of the destination which will be used later when configuring the Service Provider.

## 39.5 WebLogic Integration Configuration

### 39.5.1 Configure a WebLogic User

On the WebLogic Administration console main menu select Security Realms, select myrealm then select Users and Groups and then the Users tab to show following main screen:

Select New then input a username, this should match to the e-mail address of a Swivel user test user. Enter a dummy password as this will not be used by this integration, then press OK to save.

**Create a New User**

OK Cancel

**User Properties**

The following properties will be used to identify your new User.

\* Indicates required fields

What would you like to name your new User?

\* **Name:** a.douglas@swivelsecui

How would you like to describe the new User?

**Description:** My test user

Please choose a provider for the user.

**Provider:** DefaultAuthenticator ▼

The password is associated with the login name for the new User.

\* **Password:** ●●●●●●●●

\* **Confirm Password:** ●●●●●●●●

OK Cancel

### 39.5.2 Setting up the Service Provider

On the WebLogic Administration console main menu select Environment, Servers then select AdminServer(admin). Then select Configuration, Federation Services and SAML 2.0 General to get the following screen:

Settings for AdminServer

Configuration Protocols Logging Debug Monitoring Control Deployments Services Security Notes

General Cluster Services Keystores SSL **Federation Services** Deployment Migration Tuning Overload Health Monitoring Server Sta

SAML 1.1 Source Site SAML 1.1 Destination Site **SAML 2.0 General** SAML 2.0 Identity Provider SAML 2.0 Service Provider

Save Publish Meta Data

This page configures the general SAML 2.0 per server properties

Contact Person Given Name:

Contact Person Surname:

Contact Person Type:  ▼

Contact Person Company:

Contact Person Telephone Number:

Contact Person Email Address:

Organization Name:

Organization URL:

Published Site URL:

Entity ID:

Published Site URL should be your WebLogic URL + /saml2 and the Entity ID should be SAML\_SP to match up other aspects of the configuration. Ensure that under the Bindings option, Recipient Check Enabled is not checked and is therefore disabled. Enter other details as appropriate then press Save.

Then, from the same screen, select SAML 2.0 Service Provider to get the following screen:

Ensure the checkboxes are set as above and for the Default URL enter the path to the SAMLSwivelDemo. Press Save. Making sure that the Published Site URL is your WebLogic URL and by adding /saml2. E.g. <http://192.168.10.10/saml2> - This is your serviceProviderEndpointURL.

Going back to the section Setting up the IdP, you can go back to the settings.xml and add for example:

```
<entry key="serviceProviderEndpointURL">https://192.168.10.10/saml2</entry>
```

?

### 39.5.3 Specifying the IdP

On the WebLogic Administration console main menu select Security Realms, select myrealm then select Providers and Authentication to show following main screen:

Select New to create a SAML2IdentityAsserter and name it SAML2IdentityAsserter as shown here:

Home > Providers > SAML > Summary of Security Realm > myrealm > Users and Groups > Realm Roles > Credential Mappings > Providers

Create a New Authentication Provider

OK Cancel

Create a new Authentication Provider

The following properties will be used to identify your new Authentication Provider.  
\* Indicates required fields

The name of the authentication provider.

\* Name:

This is the type of authentication provider you wish to create.

Type:

OK Cancel

Pressing OK will take you to the following screen.

Settings for myrealm

Configuration Users and Groups Roles and Policies Credential Mappings **Providers** Migration

Authentication Password Validation Authorization Adjudication Role Mapping Auditing Credential Mapping Certification Path Keystones

An Authentication provider allows WebLogic Server to establish trust by validating a user. You must have one Authentication provider in a security realm, and you can configure multiple Authentication providers in a security realm. Different types of Authentication providers are designed to access different data stores, such as LDAP servers or DBMS. You can also configure a Realm Adapter Authentication provider that allows you to work with users and groups from previous releases of WebLogic Server.

Customize this table

Authentication Providers

### 39.5.5 Setting up the demo application

On the WebLogic Administration console main menu select Deployments to get the main screen looking as such:

**Summary of Deployments**

**Control** | Monitoring

This page displays a list of Java EE applications and stand-alone application modules that have been installed to this domain. Installed applications are first selecting the application name and using the controls on this page.

To install a new application or module for deployment to targets in this domain, click the Install button.

[Customize this table](#)

**Deployments**

Install | Update | Delete | Start v | Stop v

| <input type="checkbox"/>      | Name ^ | State | Health | Type |
|-------------------------------|--------|-------|--------|------|
| There are no items to display |        |       |        |      |

Install | Update | Delete | Start v | Stop v

Select Install then locate the WAR file for the SAMLswivelDemo as such:

**Install Application Assistant**

Back | Next | Finish | Cancel

**Locate deployment to install and prepare for deployment**

Select the file path that represents the application root directory, archive file, exploded archive directory, or application module descriptor that you wish to install.

**Note:** Only valid file paths are displayed below. If you cannot find your deployment files, upload your file(s) and/or confirm that your application contains the files.

**Path:** C:\Users\adouglas\workspace3.9.2\SAMLSwivelDemo\build\SAMLSwivelDemo.war

**Recently Used Paths:**

- C:\Users\adouglas\workspace3.9.2\SAMLSwivelDemo\build
- C:\Users\adouglas\workspace3.9.2\SAMLDemo\build
- C:\Users\adouglas\workspace3.9.2\SimpleDemo\build

**Current Location:** 192.168.0.42 \ C: \ Users \ adouglas \ workspace3.9.2 \ SAMLSwivelDemo \ build

- SAMLSwivelDemo.jar
- SAMLSwivelDemo.war

Back | Next | Finish | Cancel

Click Next, Next then Finish (using all the default options) to result in the following Screen:

Messages

- ✔ All changes have been activated. No restarts are necessary.
- ✔ The deployment has been successfully installed.

Summary of Deployments

Control Monitoring

This page displays a list of Java EE applications and stand-alone application modules that have been installed to this domain, first selecting the application name and using the controls on this page.

To install a new application or module for deployment to targets in this domain, click the Install button.

| <input type="checkbox"/> |  SAML Swivel Demo |

Install Update Delete | Start ▾ Stop ▾

The Demo should now be accessible.

### 39.6 Additional Installation Options

## 40 Verifying the Installation

Open a web browser and enter the URL for the root of the demo. In this case: <http://weblogicserverURL:7001/SAMLSwivelDemo>

This will direct the user to the identity provider's login page as such:

A screenshot of a web browser window showing the login page for SWIVEL. The browser's address bar displays the URL `192.168.0.42:8080/authenticationportal/identity_provider.jsp`. The page features the SWIVEL logo, which consists of a yellow cube icon and the text "SWIVEL the power of knowing". Below the logo, there are three input fields: "Username:", "Password:", and "OTC:". At the bottom of the form, there are two buttons: a blue "Login" button and a red "Refresh Image" button.

As per standard logon, enter the username and password (if required), start the session, enter the OTC and press ?Login?

If successful you will be authenticated and redirected to the SAMLDemo page as such:

## 41 Uninstalling the Swivel Integration

## 42 Troubleshooting

Check the Swivel logs

### 42.1 Enabling WebLogic debugging

To enable SAML logging On the WebLogic Administration console main menu select AdminServer->Configuration->Debug->Weblogic->Security->SAML2 and enable.

Now you can go to Diagnostics ->Log files ->ServerLog to view what is happening.

### 42.2 Error Messages

```
javax.security.auth.login.LoginException: [Security:090377]Identity Assertion Failed, weblogic.security.spi.IdentityAssertionException: [Security:090377]Identity Assertion Failed, weblogic.security.spi.IdentityAssertionException: [Security:096537]Assertion is not yet valid (NotBefore condition). at com.bea.common.security.internal.service.IdentityAssertionServiceImpl.assertIdentity(IdentityAssertionServiceImpl.java:89)
```

This has been seen where the time on the Swivel server is ahead of the WebLogics server. Ensure they both have the same time.

```
<BEA-000000> <[Security:096552]Illegal destination: https://<server_name>:<port>/saml2/sp/acs/post of assertion response.>
```

This is due to the Recipient destination value not matching the local (SP) assertion consumer URL. On the Weblogic Console => Environment => Servers => AdminServer => Configuration => Federation Services => SAM 2.0 General => disable ?Recipient Check Enabled? checkbox.

## 43 Known Issues and Limitations

## 44 Additional Information

For assistance in the Swivel installation and configuration please firstly contact your reseller and then email Swivel Secure support at [support@swivelsecure.com](mailto:support@swivelsecure.com).

**45 Salesforce.com**

## 46 Introduction

This document covers the integration of Swivel with Salesforce.com.

## 47 Prerequisites

Salesforce.com Administrative Account

Swivel virtual or hardware appliance or server

[PINsafe salesforce software](#) Download and unzip the salesforce.war file

The Swivel server needs to be accessible across the internet for the Salesforce.com server to connect, and the IDP is usually deployed so that it can also be access from the Internet. For security using a Swivel hardware or virtual appliance, the IDP is usually deployed in /webapps2 and accessible on port 8443 (or using a PAT on the appliance using 443)

## 48 Baseline

Salesforce 11, 12

Swivel 3.8, 3.9

## 49 Architecture

Salesforce.com users authenticate using SAML authentication against Swivel

## 50 Installation

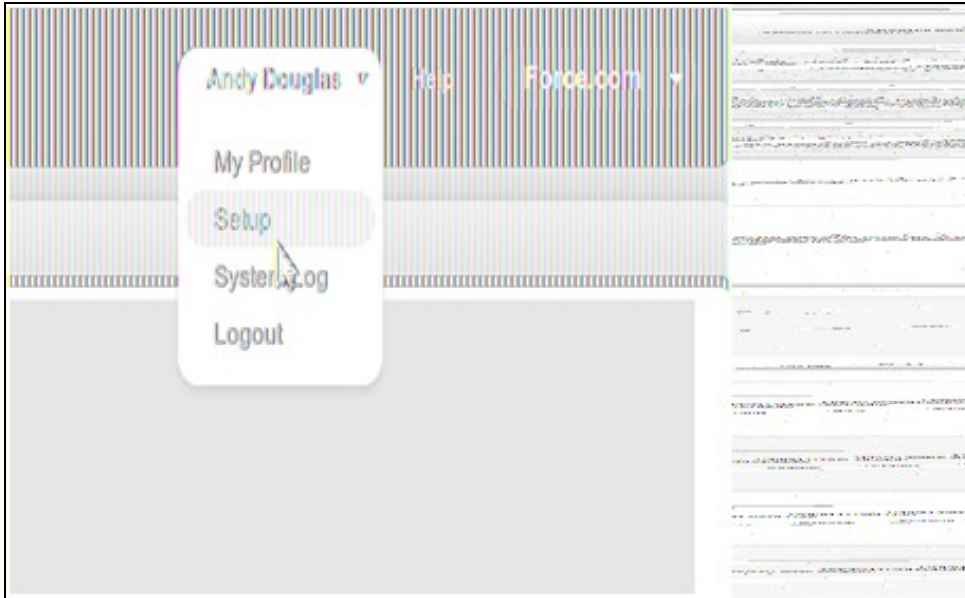

### 50.1 Salesforce.com Configuration

#### 50.1.1 Allow Authentication

Contact Salesforce.com to enable Federated SSO

#### 50.1.2 Configure Single Sign On

Using an administrative user logon to Salesforce.com and select 'Setup' from the top right button with the the user name on.

Each version of Salesforce is slightly different but each should have a screen similar to the below reached from Setup->Administrative Setup->Security Controls->Single Sign-On Settings

salesforce.com

Home Chatter Start Here

Personal Setup

- My Personal Information
- Email
- Import
- Desktop Integration
- My Chatter Settings

App Setup

- Session Settings
- Network Access
- Package Support Access
- Certificate and Key Management
- Single Sign-On Settings

## Single Sign-On Settings

Configure single sign-on in order to authenticate users in salesforce.com from external environments. Your organization has the following options available for single sign-on:

- Delegated authentication is a single sign-on method that uses a Web service call sent from salesforce.com to an endpoint.
- Federated authentication is a single sign-on method that uses SAML assertions sent to a salesforce.com endpoint.

[Edit](#) [SAML Assertion Validator](#) [Download Metadata](#)

---

**Delegated authentication**

[Edit](#) [SAML Assertion Validator](#) [Download Metadata](#)

Click on Edit. At this point you should get something similar to the screen below:

The screenshot shows the Salesforce 'Single Sign-On Settings' page. The left sidebar has three main sections: 'Personal Setup' (My Personal Information, Email, Import, Desktop Integration, My Cluster Settings), 'App Setup' (Customize, Create, Develop, Deploy, View Installed Packages, Critical Updates), and 'Administration Setup' (Manage Users, Company Profile, Security Controls, Sharing Settings, Field Accessibility, Password Policies, Session Settings, Network Access, Package Support Access, Certificate and Key Management, Single Sign-On Settings). The main content area is titled 'Single Sign-On Settings' and has 'Save' and 'Cancel' buttons at the top. It is divided into three sections: 'Delegated authentication' (Delegated Gateway URL, Force Delegated Authentication Callout), 'Federated single sign-on using SAML' (SAML Enabled, SAML Version, Identity Provider Certificate, Identity Provider Login URL, Custom Error URL, SAML User ID Type, SAML User ID Location, Entity ID), and 'Entity ID' (https://saml.salesforce.com, https://swivelsecure-developer-edition.my.salesforce.com). The SAML section is currently active and shows various configuration options like SAML Version, Identity Provider Login URL, and SAML User ID Type.

a) upload the certificate and set the issuer

b) set the login URL and logout URL to point to the instance of salesforce-pinsafe you will have running (pointing to the instance is fine as it will re-direct to the logon page automatically)

c) set the remaining settings as above

**Entity ID** The issuer in SAML requests generated by Salesforce, and is also the expected audience of any inbound SAML Responses. If you don't have domains deployed, this value is always Entity ID <https://saml.salesforce.com>. If you have domains deployed, Salesforce recommends that you use your custom domain name.

Ensure the users that you wish to use SSO are using a profile that has SSO enabled. Click Manage Users->Users. The profile assigned to each user is on the right hand side.

The screenshot displays the Salesforce 'All Users' interface. On the left, there are navigation menus for 'Personal Setup', 'App Setup', and 'Administration Setup'. The 'All Users' section is active, showing a search filter for 'Esti' and a list of users. The table below shows the details of two users:

| <input type="checkbox"/> | Active | Full Name    | Alias   | Username                        | Last Login       | Role                           | Active | Profile                | Storage |
|--------------------------|--------|--------------|---------|---------------------------------|------------------|--------------------------------|--------|------------------------|---------|
| <input type="checkbox"/> | Esti   | Gail Daniele | Gail    | gdaniele@vishaltechno.com       | 28/03/2011 13:33 | Customer Support International | ✓      | Standard Platform User |         |
| <input type="checkbox"/> | Esti   | Daniele Andy | ADaniel | andy_daniele@vishaltechno.co.uk | 28/03/2011 14:35 |                                | ✓      | System Administrator   |         |

Click on the profile and find the SSO option as shown below, ensure it is enabled. If it isn't then click edit and enable it.

## 50.2 Configure The Swivel Server

### Configure a Swivel Agent (For standard XML Authentication)

1. On the Swivel Management Console select Server/Agent
2. Enter a name for the Agent
3. Enter the IP address or hostname for the server where the salesforce.war is installed, if installed on the same server as the Swivel server use 127.0.0.1 or localhost, a default entry may already exist for this
4. Enter the shared secret to be used above on the below server configuration.
5. Click on Apply to save changes

|         |                       |  |                                       |
|---------|-----------------------|--|---------------------------------------|
| Agents: | Name:                 | <input type="text" value="local"/>       |                                       |
|         | Hostname/IP:          | <input type="text" value="127.0.0.1"/>   |                                       |
|         | Shared secret:        | <input type="password" value="....."/>   |                                       |
|         | Group:                | <input type="text" value="---ANY---"/>   |                                       |
|         | Authentication Modes: | <input type="text" value="ALL"/>         | <input type="button" value="Delete"/> |
|         |                       |  |                                       |
|         | Name:                 | <input type="text" value="IIS"/>         |                                       |
|         | Hostname/IP:          | <input type="text" value="192.168.1.1"/> |                                       |
|         | Shared secret:        | <input type="password" value="....."/>   |                                       |
|         | Group:                | <input type="text" value="---ANY---"/>   |                                       |
|         | Authentication Modes: | <input type="text" value="ALL"/>         | <input type="button" value="Delete"/> |

**Configure Single Channel Access**

- 1. On the Swivel Management Console select Server/Single Channel
- 2. Ensure ?Allow session request by username? is set to YES

## Server>Single Channel

Please specify how single channel security strings are delivered.

|   |   |
|---|---|
| Image file:   | <input type="text" value="turing.xml"/>     |
| Rotate letters:   | <input type="text" value="No"/>             |
| Allow session request by username:  | <input checked="" type="text" value="Yes"/> |
| Only use one font per image:  | <input type="text" value="Yes"/>            |
| Jiggle characters within slot:  | <input type="text" value="No"/>             |
| Add blank trailer frame to animated images:                               | <input type="text" value="Yes"/>            |
| Text Alpha Value:   | <input type="text" value="80"/>             |
| Number of complete display cycles per image:                              | <input type="text" value="10"/>             |
| Inter-frame delay (1/100s):   | <input type="text" value="40"/>             |
| Image Rendering:  | <input type="text" value="Static"/>         |
| Multiple AUTHentications per String:                                      | <input type="text" value="No"/>             |
| Generate animated images:   | <input type="text" value="No"/>             |
| Random glyph order when animating:  | <input type="text" value="No"/>             |
| No. Characters Visible:   | <input type="text" value="1"/>              |
| <input type="button" value="Apply"/> <input type="button" value="Reset"/> |   |

## 50.3 Access Device or Application Integration

### Client Side Installation

1. The SAML-salesforce war (salesforce.war) should be placed near a Swivel installation on a webserver. This could be a Swivel virtual or hardware appliance. On a Swivel virtual or hardware appliance this would need to be copied to the /usr/local/tomcat/webapps2 folder.

2. Inside the salesforce war exists a properties file (WEB-INF->settings.xml). Initially this will look something like:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE properties SYSTEM "http://java.sun.com/dtd/properties.dtd">

<properties>
<entry key="ssl">false</entry>
<entry key="server">localhost</entry>
<entry key="port">8080</entry>
<entry key="context">pinsafe</entry>
<entry key="imagesssl">>true</entry>
<entry key="imageserver">demo.swivelsecure.com</entry>
<entry key="imagecontext">proxy</entry>
<entry key="imageport">8443</entry>
<entry key="secret">secret</entry>
<entry key="selfsigned">>true</entry>
<entry key="salesforceURL">https://login.salesforce.com/?saml=02HKiPoin4nQspKPHoScmudQmsKtM.qRKnViSBCmh05IC52m5VptCNw0.p</entry>
<entry key="audience">https://saml.salesforce.com</entry>
```

```
<entry key="certificateIssuer">http://83.105.30.12:8080/SAMLSalesForce</entry>
<entry key="publicKeyFilePath">./keys/pinsafe/ssl/dsapubkey.der</entry>
<entry key="privateKeyFilePath">./keys/pinsafe/ssl/dsaprivkey.der</entry>
<entry key="certificate">./keys/pinsafe/ssl/dsacert.pem</entry>
</properties>
```

These settings should be changed to match, additional field values may need to be created as above:

- The settings for the local Swivel server

For a Swivel virtual or hardware appliance the settings may be:

```
<entry key="ssl">>false</entry>
<entry key="server">localhost</entry>
<entry key="context">pinsafe</entry>
<entry key="port">8181</entry>
<entry key="imagessl">>true</entry>
<entry key="imageserver">demo.swivelsecure.com</entry>
<entry key="imagecontext">proxy</entry>
<entry key="imageport">8443</entry>
<entry key="secret">secret</entry>
<entry key="selfsigned">>true</entry>
```

For a Swivel software install the settings may be:

```
<entry key="ssl">>false</entry>
<entry key="server">localhost</entry>
<entry key="context">pinsafe</entry>
<entry key="port">8080</entry>
<entry key="imagessl">>false</entry>
<entry key="imageserver">demo.swivelsecure.com</entry>
<entry key="imagecontext">pinsafe</entry>
<entry key="imageport">8080</entry>
<entry key="secret">secret</entry>
<entry key="selfsigned">>true</entry>
```

- The settings as per the salesforce setup (Setup->Administrative Setup->Security Controls->Single Sign-On Settings)
- The location of the keys (which must match the certificate installed in salesforce)

```
<entry key="publicKeyFilePath">./keys/pinsafe/ssl/dsapubkey.der</entry>
<entry key="privateKeyFilePath">./keys/pinsafe/ssl/dsaprivkey.der</entry>
```

## 50.4 Key and Certificate Generation

see [Key and Certificate Generation](#)

## 50.5 Additional Installation Options

## 51 Verifying the Installation

In a browser, go to the root URL for the saml-salesforce client. This will redirect to the logon page. Logging in as a user will send a saml assertion for the username you logged in as. If this username matches to a FederationID for a user in Salesforce (see above) then you will be logged in as that user
