OneTouch Authentication for Juniper

OneTouch Authentication requires a different form of integration with the Juniper SSL VPN.

The modified login page needs to redirect the user to an external OneTouch login page, eg one hosted on the Swivel Appliance.

Other aspects of the integration, eg RADIUS settings, are the same as for the standard Juniper integration.

Integration Steps

OneTouch Authentication Page

This document assumes that the OneTouch Authentication page will be deployed on an appliance in the webapps2 folder.

Download the login page from here and copy the .war file to webapps2 of the appliance

Configure the authentication page

OneTouch Jumiper Page

For standard, single stage operation the example login page can be used. The page redirects the user to the authentication page so the example page needs modifying so that the variable loginpageurl is the url for the OneTouch authentication page. This page then needs inlcuding as LoginPage.thtml in the zip file uploaded to the Juniper
