Overview

The config.xml file controls the settings for PINsafe, this document outlines the use of the config.xml file.

Prerequisites

PINsafe 3.x

Saving the config.xml

On the PINsafe Administration console select **Save Config**, and choose a download location. Note the PINsafe appliance automatically makes a backup of the config.xml, see also [Backup PINsafe How to Guide](#).

Restoring the config.xml

Note the following:

- Ensure that the current config.xml is backed up if required
- Avoid copying the config.xml to an older version of PINsafe
- Having a browser open on the Administration console may keep the Administration session open
- Some settings such as PINsafe server name, and RADIUS server IP address will be carried across, and may need to be changed manually where required

To restore the config.xml file the following steps are required:

Stop Tomcat

copy the config.xml file to <path to Tomcat>/webapps/pinsafe/WEB-INF/conf overwriting the current config.xml file.

start Tomcat
